CDI Live Scan Store and Forward BENEFITS

- Completely self-contained architecture for ease of deployment, configuration and maintenance
- Seamlessly integrates with existing live scan and AFIS network
- No additional third party software requirements
- Standard NIST/EFTS and Live Scan Interfaces included (FTP, SMTP)
- Complete transactional history and audit information maintained
- Real-time transaction information
- Can be used to manage data translation between live scans and disparate AFIS

The CDI Store and Forward provides EFTS transaction routing services for law enforcement live scan networks. It accepts submissions from remote live scans throughout the network and routes the submissions through the law enforcement workflow facilitating fingerprint identification, fingerprint card printing and transaction archiving. Remote live scans send search requests to the Store and Forward. The requests are NIST/EFTS transaction files that contain biometric and demographic information. The Store and

Forward receives these files and routes them to the appropriate system for processing. The Store and Forward also routes print requests from live scans and web clients. The Store and Forward sits between the live scan devices and the AFIS system and manages the communications between the two, caches transactions and affords more integrated solutions than directly connected live scans can. The CDI Store and Forward only requires a Java platform to run and can be deployed with little impact to operations.

MAIN FEATURES

- Java-based implementation can run on Windows, Linux or UNIX servers
- Scalable architecture can support hundreds of live scans
- High-availability features support clustering and fail-over
- Flexible configuration enables support for a wide variety of agency workflows
- Compatible with the interfaces provided by many different live scan and AFIS vendors
- Browser-based management and configuration
