QuID
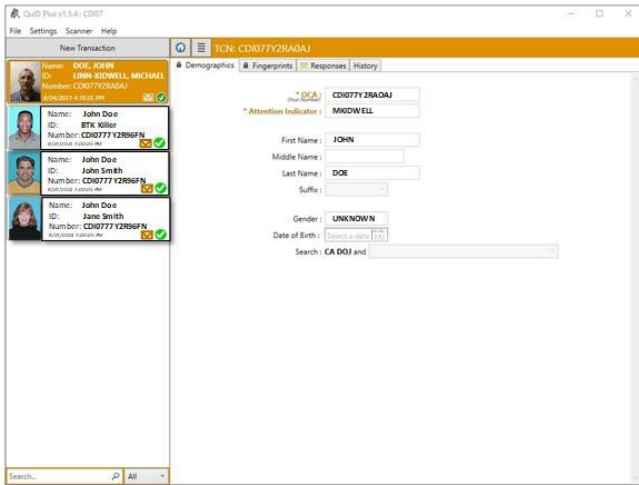

CDI Question of Identity System (QuID)

Demographic Screen

Response Screen

The CDI QuID System allows law enforcement to quickly identify persons at the beginning of the booking process before a permanent "Custody" record is created in a local Records/Jail Management System. QuID can be customized to capture any specified thumb or finger sequence for searching in a local AFIS or, with the CDI CTMC, to the DOJ Transaction Router Gateway. QuID is a lightweight application that can be deployed to virtually any Windows-based PC.

CDI designed the QuID Client to take advantage of the technical capabilities and versatility offered by the Microsoft .NET Framework. As a result, CDI is able to offer the QuID Client on standard Windows based platforms. The QuID Client can use any TCP/IP network communications protocol supported by the host including, 802.11 and others.

The QuID Client supports most common application protocols, including FTP, SMTP and SFTP. The QuID Client supports industry standard EBTS interfaces and can quickly integrate into any agency workflow. The QuID Client, when integrated with the CDI CTMC, can display rich responses to users, including biographic information, mug shots, wants and warrants and other bolo-type information.

CDI Question of Identity System

- Real-time quick identification
- Transactions using standard NIST/EBTS
- Text, SRE, XML and HTML responses
- Supports various commercially available fingerprint capture devices, including Futronic, Integrated Biometrics, HID Guardian and others
- TCP/IP Connected supporting Ethernet, GSM/GPRS, CDMA/EVDO, 802.11
- Quick and intuitive user interface minimizes training and adoption

MAIN FEATURES

- Quick ID enabled for rapid identification
- Completely NIST/EBTS compliant
- No intervening server required, can communicate directly to existing AFIS
- Supports various integration scenarios for maximum information to officers in the field
- 1-10 fingerprint capture capability
